

## 10 mobile health diabetes management companies

By: [Brian Dolan](#) | Jun 13, 2011 2:13pm EST

WellDoc

For patients with Type 2 Diabetes, WellDoc has the WellDoc DiabetesManager, an FDA-approved mobile application for tracking their disease. Launched in early 2011, the app allows patients and clinicians “real-time clinical and behavioral coaching” based on biometric information collected using a “secure capture, storage, and real-time transmission of blood glucose data,” and has a built-in analytics program for trend tracking and patient coaching. The app features integration with the AllScripts EHR service.

WellDoc worked five years on the application, and earned itself a number of mHealth industry firsts, include 501(k) FDA approval of a mHealth app and EHR integration. WellDoc, in a collaboration with Ford, recently demonstrated a prototype for diabetes tracking using the Ford Sync vehicle computer system, which could warn drivers of low blood sugar levels and insulin shock risks.
